

ENHANCED VIDEO DEVICES

For Immediate Release

EVD's First ASIC now shipping

San Diego, CA (October 12, 2008)

Enhanced Video Devices, Inc. (EVD) announced today that the EVD1000 and EVD1500 ASICs are now shipping. These two chips represent the first in a line of IC-level video enhancement products which provide single-chip solutions for a variety of markets. The all-digital devices are simple to integrate into new and existing designs, compatible with numerous data formats and operating on NTSC and ATSC video streams – up to 1080p.

The EVD family of video processors require no additional memory, etc., needing only the usual power supplies and clocks to bring powerful enhancement capability to virtually any video system.
